

# Help Desk Analysis Code

W.McGinty

December 7, 2017

## Introduction

This is a set of tools to analyse the CMS help desk (<http://cms.ncas.ac.uk/wiki/CmsHelpdesk>) database. This is an SQL database generated by the Trac (<http://trac.edgewall.org/>) part of the CMS web site.

The assumption is that the database is stored in `~/Helpdesk/trac_latest.db`.

This project began in 2017.

The code consists of a set of Bash scripts with embedded SQL queries (in 'here' documents) which produce the fundamental data in comma separated value format. These are then further analysed by R scripts to produce graphs.
